

Infor is pleased to announce expected general availability of the integration of FACTS to our Bizlinx products eStorefront and eCatalog in February 2006.\*

## **eStorefront/eCatalog**

Below is a short feature list for eCatalog and eStorefont:

**eCatalog** provides a robust product information engine for the storefront. Features include:

- an attribute-based system for searching for products. This system allows for assignment of a series of attributes to each product record, which could then be used in the search process. It goes beyond the normal free-form search mechanisms by providing lists of valid attributes for the user to choose from.
- additional fields of information for searching. This could include brand names, long descriptions, size, color, etc.
- unlimited links from the catalog records to images, specification documents, web page references, etc.
- authorized-to-buy capabilities, where a table of valid products and customers can be validated to limit access of certain products, to a selected of customers.
- routing rules based on the user or the product selected to send that user information to a specific distributor.

**eStorefront** allows your customers or employees to search your catalog, place orders, check the status of orders, check product pricing and availability, and review account information. Features include:

- Quick, secure customer logon and authorization
- Real-time product availability, order status, order detail checking and account status
- Order history review, searchable by date and other filters
- Express order entry and personalized shopping lists for repeat purchases
- Real-time order entry system with flexible pricing
- Email order confirmation

For more information on these products, visit:

## **FACTS API Toolkit**

To enable external programs such as eStorefront to exchange information with FACTS, the FACTS Development Team is offering a new tool called the FACTS API Toolkit. This product exchanges data with external systems via XML documents. FACTS business logic is used by the Toolkit to ensure data coming into FACTS and being returned from FACTS is valid.

## **Pricing**

List pricing for eStorefront and eCatalog are posted in the Pricing section of the FACTS Nexus. Early adopter pricing will be announced as well.

## **For FACTS Channel Partners**

Look for upcoming announcements regarding:

- Sales Training
- Technical Training
- General Teaser Webinars
- Hardware/OS Guidelines
- Installation and Other Documentation
- Case Studies

\*eCatalog is available today for partners who would like to populate data from FACTS into eCatalog by creating custom programs. However, the full integration for eCatalog will be delivered by Infor in February.
